# Options for Session ID and Control Code for STAMP Message Format

draft-gandhi-spring-twamp-srpm-07 draft-ietf-ippm-stamp-option-tlv-03

Presenter: Rakesh Gandhi (rgandhi.ietf@gmail.com)

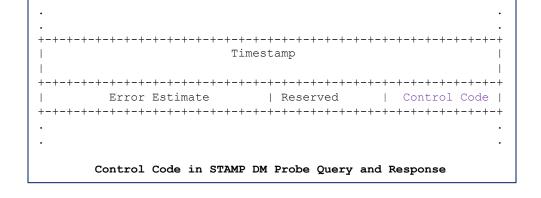

Updated: March 16, 2020

## STAMP Control Code Field

#### For a Query:

0x0: Out-of-band Response Requested. This is also the default behavior.

Ox1: In-band Response Requested.
Indicates that this query has been sent over a bidirectional path and the probe response is required over the same path in the reverse direction. The bidirectional path does not have to be an SR path.

#### For a Response -> Need to return Errors

0x1: Error - Invalid Message. Indicates that the operation failed because the received query message could not be processed.

0xN: Additional Error will be defined in future

### Option 1: Variable Length Session ID Part of Existing Sequence Number

```
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
                         0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
Session ID / Sequence Number
                                 Sequence Number
Timestamp
                                  Timestamp
Error Estimate
                 Control Code
                            Error Estimate
                                          Control Code
Receive Timestamp
                         MBZ (28 octets)
                           Sender Session ID / Sender Sequence Number
                         Session-Sender Timestamp
                         Session-Sender Error Estimate
                         Ses-Sender TTL
Figure: Sender Message Format in STAMP
                              Figure: Reflector Message Format in STAMP
```

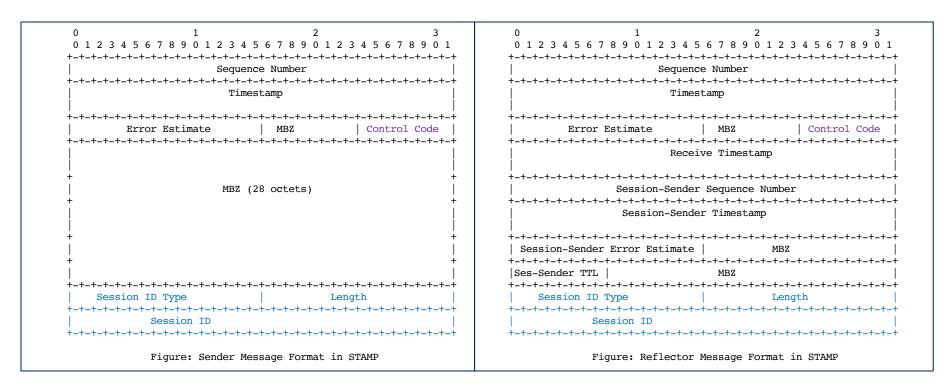

✓ No change for Session ID – local implementation behavior at Sender

### Option 2: Using 24-Bit Session ID Field

```
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
                          0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
Sequence Number
                                  Sequence Number
Timestamp
                                  Timestamp
                         Error Estimate
                 Control Code
                             Error Estimate
                                           Control Code
Session ID
                                   Receive Timestamp
MBZ (24 octets)
                            Sequence Number
                         Session-Sender Timestamp
                         Session-Sender Error Estimate
                         Session-Sender Session ID
                          |Ses-Sender TTL |
Figure: Sender Message Format in STAMP
                             Figure: Reflector Message Format in STAMP
```

- ✓ Session ID has 24-bits
- Requires the reflector to copy it elsewhere in the packet to return it back not desired
- o It's also difficult to find a good place in authenticated test packets

#### Option 3: 32-bit Session ID in TLV

- ✓ Session ID has 32-bits
- Session ID is preferably placed in a fixed position of the test packets TLV not desired

#### Option 4: 16-bit Session ID - 1

0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 Sequence Number Sequence Number Timestamp Timestamp Error Estimate Session ID Error Estimate Session ID Receive Timestamp MBZ (28 octets) Session-Sender Sequence Number Session-Sender Timestamp Session-Sender Error Estimate Ses-Sender TTL Control Code Type Control Code Type Control Code Control Code Figure: Sender Message Format in STAMP Figure: Reflector Message Format in STAMP

- ✓ Session ID has only 16-bits is this enough?
- Control code not compatible with existing TWAMP message not favorable
- o Control code is desired to be at fixed location when reflector implemented in hardware

#### Option 5: 16-bit Session ID - 2

```
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
                          0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
                         Sequence Number
                                  Sequence Number
Timestamp
                                   Timestamp
Error Estimate
                                      Session ID
            Session ID
                             Error Estimate
TX Control Code
                                   Receive Timestamp
MBZ (24 octets)
                                Session-Sender Sequence Number
                         Session-Sender Timestamp
                         Session-Sender Error Estimate | RX Control Code | MBZ
                         Ses-Sender TTL
Figure: Sender Message Format in STAMP
                              Figure: Reflector Message Format in STAMP
```

- ✓ Session ID has only 16-bits is this enough?
- ✓ Control code is TX and RX direction specific hence copy of TX to RX not required

## Next Steps

- Converge on an option for STAMP message format
- Update the respective drafts with the agreed option

# Thank you
